

# 1 in 4

**Swiss websites is a digital ghost — the name exists, but nothing is behind it.**

450,916 .ch domains resolve to no server at all. You could be trusting a link that leads nowhere — or worse, somewhere you didn't expect.

# 45%

**of Swiss domains can be used to send fake emails in your name — right now.**

No hacking required. 1.1 million .ch domains have no protection against email impersonation. Anyone can forge "info@yourbusiness.ch" and your customers won't see a warning.

# 1 in 3

**Swiss websites sends your data unencrypted — like a postcard, not a sealed envelope.**

28.3% of live .ch sites still use plain HTTP. Every form you fill in, every password you type, every message you send travels across the internet in plain text — readable by anyone on the same network.

OPEN DOORS

# 870K

**Swiss websites leave their admin login panel open to anyone on the internet.**

That's 34% of all .ch domains — control rooms with unlocked front doors. In retail and hospitality, it's 1 in 2. No special skills needed to find them: just type /admin.

# 313K

**Swiss websites expose their database directly to the open internet — no password needed.**

MySQL databases, file shares, and container management systems reachable by anyone. 688,000 domains expose FTP — that's 42% of all scanned. In finance: 37 Elasticsearch and 34 Redis instances, often with no authentication at all.

# 93.8%

**of Swiss domains can have their traffic silently redirected — without the owner ever knowing.**

Only 6.2% of .ch domains have DNSSEC — a basic lock on the internet's address book. Without it, an attacker can quietly point your domain to a fake website or intercept your email. Finance leads at 12% adoption. That still means 88% of Swiss financial domains are exposed.

# 49.1%

**of Swiss websites send zero browser security instructions — leaving visitors completely unguarded.**

Modern browsers can enforce protections against hijacking, clickjacking, and data leaks — but only if the website asks them to. Nearly half of Swiss sites never do. The legal sector is worst: 61.6% send nothing at all.

# 40.6%

**of Swiss websites are hosted outside Switzerland — beyond the reach of Swiss law.**

207,977 .ch domains have both their servers and their DNS controls abroad. German and US providers dominate. Swiss data protection law may say one thing — but the infrastructure that carries your data answers to someone else.

# 1 in 5

**Swiss websites runs WordPress — one vulnerability affects them all at once.**

WordPress powers 71.5% of identifiable CMS sites in Switzerland — roughly 19% of every live .ch domain. When a critical WordPress flaw is discovered, it doesn't threaten one website. It threatens a fifth of the Swiss web simultaneously.

## KNOWN VULNERABILITIES

# 977K

**Swiss websites run software with security holes that hackers are actively exploiting today.**

38% of all .ch domains match vulnerabilities on the US government's official "currently being exploited" list. These aren't theoretical risks — they are attacks happening right now, on Swiss infrastructure.

# 29.3%

**of the Swiss internet's DNS is controlled by just 3 providers.**

One outage at any of them is a national DNS event — tens of thousands of Swiss websites go dark simultaneously. This is the actual map of that dependency: 50,000 .ch domains, every nameserver relationship visible.
